IN BRIEF

Leveraging a strong foundation in biological transport phenomena and numerical simulations to engineer complex biological systems for pathophysiological research and preclinical studies, including organ-on-chip and organoid technologies. Integrated skills in computational modeling, quantitative imaging, and molecular biology enabling mechanistic modeling of disease processes and drug responses across multiple scales.

EDUCATION

Massachusetts Institute of Technology *September 2018 - June 2021*
Ph.D. in Mechanical Engineering
Thesis: On-Chip Engineered Human Lymphatic Microvasculature for Physio-/Pathological Transport Phenomena Studies

Massachusetts Institute of Technology *September 2016 - June 2018*
M.S. in Mechanical Engineering
Thesis: Engineering 3D Lymphatic Vasculature On-Chip Through Biochemical and Mechanical Stimuli

University of Puerto Rico at Mayaguez *August 2012 - June 2016*
B.S. in Mechanical Engineering (Summa Cum Laude)
Honors Thesis: Adaptive Responses of Murine Osteoblasts Subjected to Coupled Mechanical Stimuli

WORK EXPERIENCE

Cellino Biotech May 2023 - Present
Biomedical Fluidic Engineer

Biophysical Characterization and Modeling of iPSCs Biomanufacturing
· Derived analytical and numerical models on relevant heat and fluid transport phenomena, enabling the optimization of design principles for our laser-based cell editing platform.
· Developed and optimized biological assays with induced-pluripotent stem cells to evaluate the functional thresholds for cell editing utilizing our laser-based bioprocessing techniques.
· Designed and built instrumentation to measure the physicochemical properties of biocompatible ceramic thin-films, and an optical set-up to visualize flow dynamics in cell-culture chambers.
· Streamlined fluorescent data quantification from bioprocess outputs with custom Python-based image processing pipelines.

Wyss Institute for Biologically Inspired Engineering July 2021 -May 2023
Postdoctoral Research Fellow

High-throughput, Micro-Patterned Organoid Systems
· Developed microfluidic droplet-based techniques for single-cell encapsulation with patterned extracellular matrix droplets (patent pending), thus permitting high-throughput generation and screening of organoid systems. Commercialization of such platform is currently under development through a Wyss Institute Partnership.

Harvard University July 2021 - May 2023
Postdoctoral Research Fellow

Microfluidic-based Bioassays for Next-Generation Diagnostics and Therapeutics
· Built an integrated droplet digital PCR (ddPCR) with nanoplasmonic photothermal heating, thus achieving viral/bacterial DNA detection in less than 5 minutes. Furthermore, implemented low-cost, minimal equipment to facilitate its widespread use in clinics and at-home.
· Designed a novel microfluidic-based fluid mixer (patent pending) for high-throughput and uniform synthesis of lipid nanoparticles for mRNA vaccine delivery.

Massachusetts Institute of Technology September 2016 - June 2021
Graduate Student Researcher

On-Chip Engineered, Physiologically-Functional Lymphatic Vasculature
· Optimized the *in vitro*, angiogenic growth of lymphatic capillaries to mimic their *in vivo* morphology and function, in a versatile microfluidic platform implemented for disease models and drug screening.
· Developed analytical and computational models to study the relevant transport phenomena that drive protein drainage and inflammatory-immune signals by the engineered lymphatic vasculature.
· Collaborated with Amgen Inc. by utilizing our on-chip engineered lymphatics to screen and characterize vascular transport of their new monoclonal antibody candidates. Based on the measured transport parameters, developed a physiological-based pharmacokinetic (PBPK) framework predicting differences in bioavailability.
· Additional projects included the development of novel microfluidic systems to recapitulate biomechanical stimuli (microvascular flow and oxygen-tension gradients) and computational models characterizing chemotactic gradients during brain cancer metastasis.

Harvard Medical School June 2015 - August 2015
Undergraduate Student Researcher

Engineered Flow-Activated Endothelial Cell Sensor for Atherosclerosis Studies
· Characterized a transcriptionally-activated cellular sensor (KLF2-GFP promoter) capable of exhibiting a quantitative fluorescent response when endothelial cells are exposed to atherosclerosis-prone flow patterns, thus allowing real-time visualization of flow shear stress on cell physiology.
· Validated the versatility of the cell-based sensor as a fluorescent readout in drug screening studies for chemically inducing an atherosclerosis-protective endothelial phenotype despite the presence of atherosclerosis-prone flow patterns.

Princeton University June 2014 - August 2014
Undergraduate Student Researcher

Characterizing Viscoelasticity of Bacterial Biofilms via Micro-Membrane Rheometry
· Designed a microfluidic-based rheometer capable of measuring the elasticity of bacterial biofilms by the application of fixed air pressure to a micro-membrane in contact with the biofilm channel.
· Developed a COMSOL-based finite element analysis model to estimate the elasticity of the bacterial biofilm, based on the experimental measurements of the resultant deformations to the applied pressures.

University of Puerto Rico at Mayaguez August 2013 - December 2015
Undergraduate Student Researcher

Adaptive Responses of Murine Osteoblasts Subjected to Coupled Mechanical Stimuli
· Analyzed the orientational response of the actin cytoskeleton and expression of focal adhesion complexes in murine osteoblasts as a result of simultaneous mechanical cues (matrix stiffness and cyclic tensional strain) to induce preferential cellular alignment for functional bone tissue constructs.

INTELLECTUAL PROPERTY/PATENTS

- *Single-cell derived organoids in extracellular matrix droplets.* (US patent pending)
- *Flexus Mixer: A microfluidic-based mixer for nanoparticle synthesis.* (US patent pending)
- *Microphysiological Model of the Brain.* (US patent pending)

TECHNICAL STRENGTHS

Programming Languages:	Python, MATLAB, R, Phoenix NLME, LabVIEW, LaTeX, ImageJ1
Simulation/Modeling:	ODEs/PDEs, Lumped-Compartmental, Finite Element (COMSOL, Ansys)
Microscopy:	Confocal, Epifluorescence, High-speed/Time-Lapse
Molecular Biology:	PCR, Immunofluorescence, Flow Cytometry, ELISA, Western Blot
Microfabrication:	AutoCAD, Photo/Soft-lithography, Micromachining, 3D Printing
Culturing and Handling:	Mammalian Cells & Tissue, Bacteria

AWARDS AND HONORS

Invited Keynote Speaker: FluidicMEMS Consortium, Cambridge M.A. *(2024)*

El Mundo Boston's Latino 30 under 30 *(2022)*

MIT University Center for Exemplary Mentoring (UCEM) Sloan Scholar *(2018)*

National Science Foundation (NSF) Graduate Research Fellowship *(2017)*

MIT Office of the Dean for Graduate Education (ODGE) Diversity Fellowship *(2016)*

NIH RISE 2 BEST Program *(2013 - 2016)*
